

Identify *Legionella* to Prevent an Outbreak with WTI laboratory services

The Resourceful, Rapid and Reliable Choice

Your samples can be analyzed with three **resourceful** methods utilizing multi-tiered NCM techniques: Non-Culture, Culture, and Molecular.

Accurate and definitive identification is a key element in causal factor determination, as well as correct diagnostic, treatment and management for *Legionella* related diseases and outbreaks. NCM employs basic and advanced techniques, providing highly sensitive and precise identification of this bacteria at the genus and/or species level, to address health and hygiene related issues.

Molecular analysis performed by PCR (DNA) provides a rapid public health response time, often within a 4 to 24-hour window in the case of an emergency outbreak.

Real-time PCR *Legionella* testing provides highly sensitive qualitative and

quantitative results from smaller sample volumes within a few hours. **Rapid** turnaround time of this technique facilitates an action plan while responding to the emergency.

The laboratory at WTI's Standard Reference for Quality (SRQ) Verification performance ensures **reliable** data that can be acted upon. After your analysis is complete you be provided with a detailed, yet easy to understand, report on the findings. This report can help you to develop a management and remediation plan.

Plus, smaller sample volumes are accepted, and be sure to ask us about a bulk sample discount.

WTI laboratory services is a multi-discipline indoor air and environmental quality (IAQ/IEQ) facility with a team of microbiologists at the ready to assist you.

*Rush fees will apply for emergency response.
